1. From

$$\mathbf{B}(\mathbf{x}) = \frac{\mu_0 I}{4\pi} \oint_C d\mathbf{l}' \times \frac{\mathbf{x} - \mathbf{x}'}{|\mathbf{x} - \mathbf{x}'|^3}$$
 (1)

and with the obvious choice of coordinate system, for the point \mathbf{x} , on the axis, we have

$$\mathbf{x} = (0,0,z) \qquad \mathbf{x}' = (a\cos\phi', a\sin\phi', 0) \qquad d\mathbf{l}' = (-a\sin\phi', a\cos\phi', 0)d\phi' \qquad (2)$$

Thus

$$\mathbf{B}(0,z) = \frac{\mu_0 I}{4\pi} \cdot 2\pi \frac{a^2}{\sqrt{a^2 + z^2}} \hat{\mathbf{z}} = \frac{\mu_0 I a^2}{2} \cdot \frac{1}{\sqrt{a^2 + z^2}} \hat{\mathbf{z}}$$
(3)

2. With the two loops and shift of origin, we get

$$\mathbf{B}(0,z) = \frac{\mu_0 I a^2}{2} \left[\frac{1}{\sqrt{a^2 + (b/2 - z)^2}^3} + \frac{1}{\sqrt{a^2 + (b/2 + z)^2}^3} \right] \hat{\mathbf{z}}$$
(4)

The Taylor expansion

$$(1+x)^{-3/2} = 1 - \frac{3x}{2} + \frac{15x^2}{8} - \frac{35x^3}{16} + \frac{315x^4}{128} + \cdots$$
 (5)

gives (recall $d^2 = a^2 + b^2/4$)

$$\frac{1}{\sqrt{a^2 + (b/2 \pm z)^{2^3}}} = \frac{1}{d^3} \left(1 \pm \frac{bz}{d^2} + \frac{z^2}{d^2} \right)^{-3/2}$$

$$= \frac{1}{d^3} \left[1 - \frac{3}{2} \left(\pm \frac{bz}{d^2} + \frac{z^2}{d^2} \right) + \frac{15}{8} \left(\pm \frac{bz}{d^2} + \frac{z^2}{d^2} \right)^2 \right]$$

$$- \frac{35}{16} \left(\pm \frac{bz}{d^2} + \frac{z^2}{d^2} \right)^3 + \frac{315}{128} \left(\pm \frac{bz}{d^2} + \frac{z^2}{d^2} \right)^4 + \cdots \right]$$

$$= \frac{1}{d^3} \left[1 - \frac{3}{2} \left(\pm \frac{bz}{d^2} + \frac{z^2}{d^2} \right) + \frac{15}{8} \left(\frac{b^2 z^2}{d^4} \pm 2 \frac{bz^3}{d^4} + \frac{z^4}{d^4} \right) \right]$$

$$- \frac{35}{16} \left(\pm \frac{b^3 z^3}{d^6} + 3 \frac{b^2 z^4}{d^6} \right) + \frac{315}{128} \frac{b^4 z^4}{d^8} + O(z^5) \right] \tag{6}$$

Notice when we plug (6) into (4), the \pm terms cancel and the remaining terms double. This gives

$$\mathbf{B}(0,z) = \hat{\mathbf{z}} \frac{\mu_0 I a^2}{d^3} \left[1 + z^2 \left(\frac{15b^2}{8d^4} - \frac{3}{2d^2} \right) + z^4 \left(\frac{15}{8d^4} - \frac{105b^2}{16d^6} + \frac{315b^4}{128d^8} \right) + O\left(z^5\right) \right]$$
(7)

The claim is proved by noticing

$$\frac{15b^2}{8d^4} - \frac{3}{2d^2} = \frac{15b^2 - 12d^2}{8d^4} = \frac{15b^2 - 12(a^2 + b^2/4)}{8d^4} = \frac{3(b^2 - a^2)}{2d^4} \tag{8}$$

$$\frac{15}{8d^4} - \frac{105b^2}{16d^6} + \frac{315b^4}{128d^8} = \frac{240d^4 - 840b^2d^2 + 315b^4}{128d^8}$$

$$= \frac{240(a^4 + a^2b^2/2 + b^4/16) - 840(b^2a^2 + b^4/4) + 315b^4}{128d^8}$$

$$= \frac{240a^4 - 720a^2b^2 + 120b^4}{128d^8} = \frac{15(b^4 - 6a^2b^2 + 2a^4)}{16d^8}$$
(9)

3. To calculate field for small ρ , we will use the result from problem 5.4:

$$B_z(\rho, z) \approx B_z(0, z) - \frac{\rho^2}{4} \left[\frac{\partial^2 B_z(0, z)}{\partial z^2} \right]$$
 (10)

$$B_{\rho}(\rho,z) \approx -\frac{\rho}{2} \left[\frac{\partial B_{z}(0,z)}{\partial z} \right]$$
 (11)

Observe that

$$\frac{\partial}{\partial z} \left(\frac{1}{\sqrt{a^2 + (b/2 \pm z)^2}} \right) = \frac{\left(-\frac{3}{2} \right) (\pm 2)(b/2 \pm z)}{\sqrt{a^2 + (b/2 \pm z)^2}} = \frac{\pm 3(b/2 \pm z)}{\sqrt{a^2 + (b/2 \pm z)^2}}$$
(12)

Using Taylor expansion

$$(1+x)^{-5/2} = 1 - \frac{5x}{2} + \frac{35x^2}{8} + \cdots$$
 (13)

we get (12) up to the z^2 order:

$$\frac{\partial}{\partial z} \left(\frac{1}{\sqrt{a^2 + (b/2 \pm z)^2}} \right) = \mp 3 \left(b/2 \pm z \right) \cdot \frac{1}{d^5} \left[1 - \frac{5}{2} \left(\pm \frac{bz}{d^2} + \frac{z^2}{d^2} \right) + \frac{35}{8} \frac{b^2 z^2}{d^4} + O\left(z^3\right) \right]
\approx \frac{1}{d^5} \left(\mp \frac{3b}{2} - 3z \right) \left[1 \mp \frac{5bz}{2d^2} + z^2 \left(\frac{35b^2}{8d^4} - \frac{5}{2d^2} \right) \right]
\approx \frac{1}{d^5} \left\{ \mp \frac{3b}{2} + z \left(\frac{15b^2}{4d^2} - 3 \right) \pm z^2 \left[\frac{15b}{2d^2} - \frac{3b}{2} \left(\frac{35b^2}{8d^4} - \frac{5}{2d^2} \right) \right] \right\}$$
(14)

When (14) is inserted into (11), the \pm terms will cancel, which leaves

$$B_{\rho}(\rho, z) = \left(-\frac{\rho}{2}\right) \cdot \left(\frac{\mu_0 I a^2}{2}\right) \frac{2}{d^5} \left(\frac{15b^2}{4d^2} - 3\right) z + O(z^3)$$

$$\approx -\rho z \cdot \left(\frac{\mu_0 I a^2}{2}\right) \cdot \left(\frac{15b^2 - 12d^2}{4d^7}\right)$$

$$= -\rho z \underbrace{\left(\frac{\mu_0 I a^2}{2}\right) \left[\frac{3(b^2 - a^2)}{d^7}\right]}_{=q_0}$$
(15)

From (12), we have

$$\frac{\partial^{2}}{\partial z^{2}} \left(\frac{1}{\sqrt{a^{2} + (b/2 \pm z)^{2}}} \right) = \frac{-3}{\sqrt{a^{2} + (b/2 \pm z)^{2}}} \mp \frac{3(b/2 \pm z) \left(-\frac{5}{2} \right) (\pm 2)(b/2 \pm z)}{\sqrt{a^{2} + (b/2 \pm z)^{2}}}$$

$$= \frac{-3 \left[a^{2} + (b/2 \pm z)^{2} \right] + 15(b/2 \pm z)^{2}}{\sqrt{a^{2} + (b/2 \pm z)^{2}}}$$

$$= \frac{12(b/2 \pm z)^{2} - 3a^{2}}{\sqrt{a^{2} + (b/2 \pm z)^{2}}}$$

$$= \frac{3(b^{2} - a^{2})}{d^{7}} + O(z)$$
(16)

When (16) is inserted back into (10), we see the $\rho^2 z^0$ term has coefficient

$$-\frac{1}{4} \cdot 2 \cdot \left[\frac{3(b^2 - a^2)}{d^7} \right] \cdot \left(\frac{\mu_0 I a^2}{2} \right) = -\frac{\sigma_2}{2}$$
 (17)

The $z^2 \rho^0$ and $z^0 \rho^0$ terms of (10) both come from $B_z(0,z)$, which are available from (7) and (8)

$$\rho^0 z^0: \qquad \frac{\mu_0 I a^2}{d^3} = \sigma_0 \tag{18}$$

$$z^2 \rho^0: \qquad \left(\frac{\mu_0 I a^2}{2}\right) \cdot \left[\frac{3\left(b^2 - a^2\right)}{d^7}\right] = \sigma_2 \tag{19}$$

4. For large |z|, we will expand (4) alternatively:

$$\frac{1}{\sqrt{a^2 + (b/2 \pm z)^2}} = \frac{1}{|z|^3} \left(1 \pm \frac{b}{z} + \frac{d^2}{z^2} \right)^{-3/2}$$

$$= \frac{1}{|z|^3} \left[1 - \frac{3}{2} \left(\pm \frac{b}{z} + \frac{d^2}{z^2} \right) + \frac{15}{8} \left(\pm \frac{b}{z} + \frac{d^2}{z^2} \right)^2 - \frac{35}{16} \left(\pm \frac{b}{z} + \frac{d^2}{z^2} \right)^3 + \frac{315}{128} \left(\pm \frac{b}{z} + \frac{d^2}{z^2} \right)^4 + \cdots \right]$$

$$= \frac{1}{|z|^3} \left[1 - \frac{3}{2} \left(\pm \frac{b}{z} + \frac{d^2}{z^2} \right) + \frac{15}{8} \left(\frac{b^2}{z^2} \pm 2 \frac{bd^2}{z^3} + \frac{d^4}{z^4} \right) - \frac{35}{16} \left(\pm \frac{b^3}{z^3} + 3 \frac{b^2 d^2}{z^4} \right) + \frac{315}{128} \frac{b^4}{z^4} + O\left(\frac{1}{z^5} \right) \right] \tag{20}$$

Similarly collecting the non-canceling terms in (4) gives

$$B_{z}(0,z) \approx \frac{\mu_{0}Ia^{2}}{|z|^{3}} \left[1 + z^{-2} \left(\frac{15b^{2}}{8} - \frac{3d^{2}}{2} \right) + z^{-4} \left(\frac{15d^{4}}{8} - \frac{105b^{2}d^{2}}{16} + \frac{315b^{4}}{128} \right) \right]$$

$$= \frac{\mu_{0}Ia^{2}}{|z|^{3}} \left[1 + \frac{3(b^{2} - a^{2})}{2z^{2}} + \frac{15(b^{4} - 6a^{2}b^{2} + 2a^{4})}{16z^{4}} \right]$$
(21)

which is exactly result (b), i.e., equation (7)-(9) with the substitution $d \rightarrow |z|$.

5. When a = b, the ratio of deviation from field at origin in (9) is

$$\epsilon = \frac{15(-3b^4z^4)}{16(d^2)^4} = \frac{-45b^4z^4}{16\cdot\left(\frac{5b^2}{4}\right)^4} = \left(\frac{z}{b}\right)^4 \cdot \left[\frac{-45}{16\left(\frac{5}{4}\right)^4}\right] \approx -1.152\left(\frac{z}{b}\right)^4$$
 (22)

Thus

for
$$|\epsilon| \le 10^{-4}$$
 \Longrightarrow $\frac{z}{b} \le 0.096$ for $|\epsilon| \le 10^{-2}$ \Longrightarrow $\frac{z}{b} \le 0.305$ (23)
